SportDevices End User License & Warranty Disclaimer

DISCLAIMERS

Limitations of warranties and liability: This Power Supply, including its embedded firmware, is provided and licensed by SportDevices on an "as is" basis, without any other warranties or conditions, express or implied, including, but not limited to, warranties of merchantable quality, satisfactory quality, merchantability or fitness for a particular purpose or non-infringement, or those arising by law, statute, usage of trade, course of dealing or otherwise. The entire risk as to the results and performance of this product is assumed by you. To the maximum extent permitted by applicable law, neither SportDevices, its dealers or suppliers shall have any liability to you or any other person or entity for any indirect, incidental, special, or consequential damages whatsoever, including, but not limited to, loss of revenue or profit, lost or damaged data or other commercial or economic loss, even if SportDevices. has been advised of the possibility of such damages, or they are foreseeable. SportDevices is also not responsible for claims by a third party. Other possible damages INCLUDE VEHICLE OR ENGINE DAMAGES, DYNAMOMETER DAMAGES, AND PERSONAL INJURIES. The limitations set forth herein shall apply whether or not the alleged breach or default is a breach of a fundamental condition or term or a fundamental breach.

Any disputes arising between the parties over any products, services, warranties, terms, agreements, etc. shall be governed under the laws of Valencia (Spain) and in an appropriate court within its jurisdiction.

This Product License Warranty Disclaimer supersedes all prior warranty statements. Inquiries concerning this Product Warranty Disclaimer should be directed to:

SportDevices
Cami del Port 145, 46470 Catarroja, Spain
General Safety Instructions

Use the following safety guidelines to help ensure your own personal safety and to help protect your equipment and working environment from potential damage.

SAFETY: General Safety

When setting up the equipment for use:

- Place the equipment on a hard, level surface. If the equipment is installed in a closed-wall unit, ensure that there is enough ventilation.
- Avoid placing objects on top of this equipment to permit the airflow required for proper ventilation. Restricting airflow can damage the equipment.
- Keep your device away from radiators and heat sources.
- Keep your equipment away from extremely hot or cold temperatures to ensure that it is used within the specified operating range. (check technical parameters section)
- Keep your equipment away from Electromagnetic emitting devices like CDI ignition, or electric motors / VFD (Variable Frequency Drive)
- Do not push any objects into the air vents or openings of your equipment. Doing so can cause fire or electric shock by shorting out interior components.
- Ensure that nothing rests on your equipment's cables and that the cables are not located where they can be stepped on or tripped over.

When operating your equipment:

- Installation place must be dry, cool and free of strong vibrations.
- Ensure that ventilation is enough; if necessary drill the enclosure to ease ventilation.
- Do not use AC powered equipment during an electrical storm.
- Do not spill food or liquids on your equipment.
- Before you clean your equipment, disconnect it from the electrical outlet. Clean your device with a soft cloth dampened with water. Do not use liquids or aerosol cleaners, which may contain flammable substances.
- Clean the display with a soft, clean cloth and water. Apply the water to the cloth, then stroke the cloth across the display in one direction, moving from the top of the display to the bottom. Remove moisture from the display quickly and keep the display dry.
- Long-term exposure to moisture can damage the display. Do not use a commercial window cleaner to clean your display.

⚠️ CAUTION: Do not operate your equipment with any cover(s) removed.

- If your equipment does not operate normally - in particular, if there are any unusual sounds or smells coming from it - unplug it immediately and contact an authorized dealer or service center.

⚠️ WARNING: To prevent the spread of fire, keep open flames away from this product at all times.
SAFETY: When Working Inside Your Device

Do not attempt to service the equipment yourself, except as explained in your documentation or in instructions otherwise provided to you by SportDevices. Always follow installation and service instructions closely.

The only user configurable parts in this device are: jumpers and wiring.

All parts in this equipment are powered to grid, even the low voltage parts as LCD, switches, jumpers, BT dongle (when present), etc, are directly connected to grid. Do not touch any of the electrical parts unless the circuit breaker is OFF.

SAFETY: General Power Safety

Voltages used in this device are capable of killing a person! Read carefully this section.

By default, if other values are not specified, all SportDevices equipment are rated for 230 VAC / 50 Hz. (115 VAC units will have a specific label for that)

All parts in this equipment are powered to grid, even the low voltage parts as LCD, switches, jumpers, BT dongle (when present), etc, are directly connected to grid. Do not touch any of the electrical parts unless the circuit breaker is OFF.

Observe the following guidelines when connecting your equipment to a power source:

- Check the voltage rating before you connect the equipment to the grid to ensure that the required voltage and frequency match the available power source.
- This equipment is designed to have a permanent installation to the grid through a circuit breaker and a differential switch.
- Ensure both power lines (L and N) are correctly connected to the 230 V input connector, and ground cables are correctly connected to ground screws.
- Brake and dynamometer must not be operated without the GND cable installed and a differential switch.
- All wires must be in good condition and the brake must not have leakages. Note that some brakes from junk yard may have current leakages and must not be used until coils are verified and repaired.
- Dynamometer must have its own GND cable directly to the grid, as the brake is floating over bearings and may not have enough protection in case some of the wires are in bad condition and touching the dynamometer chassis.
- Connection can also be made through a power cord, but ensure the power cord rating is suitable for the brake application (typically 16 Amp or higher), and ground is correctly connected from the equipment to building Ground and to brake and dynamometer.

SAFETY: If Your Device Gets Wet

⚠️ CAUTION: Before you begin any of the procedures in this section, see the SAFETY: General Safety section of this document.
CAUTION: Perform this procedure only after you are certain that it is safe to do so. If the device is connected to an electrical outlet, turn off the AC power at the circuit breaker, if possible, before attempting to remove the power cables from the electrical outlet. Use the utmost caution when removing wet cables from a live power source.

1. Disconnect the AC cord from the electrical outlet, and then, if possible, disconnect the AC cord from the device.
2. Turn off any attached external devices, then disconnect them from their power sources, and then from the device.
3. Contact SportDevices support (info@sportdevices.com)

Limited Warranties: warranty is limited to normal usage of the device, any fault caused by inappropriate usage or accident will not be covered

SAFETY: If You Drop or Damage Your Equipment

CAUTION: Before you begin any of the procedures in this section, see the SAFETY: General Safety and Power Safety sections of this document.

4. CAUTION: If any internal components can be seen through damaged portions, or if smoke or unusual odors are detected, disconnect the device from the electrical outlet and contact SportDevices support (info@sportdevices.com)

1. Save and close any open files, exit any open programs, and shut down the computer.
2. Turn off the device and disconnect from the power source, and then disconnect from the computer.
3. Turn off any attached external devices, and disconnect them from their power sources and then from the computer.
4. Connect the device to the power source and turn on the device.
5. If the device does not start, or if smoke or unusual odors are detected, or you cannot identify the damaged components, contact SportDevices support.

Protecting Against Electrostatic Discharge

CAUTION: Disconnect product from mains power source in accordance with product specific safety information located on the “Safety Information” section of this website.

Electrostatic discharge (ESD) events can harm electronic components inside your device. Under certain conditions, ESD may build up on your body or an object, such as a peripheral, and then discharge into another object, such as your device. To prevent ESD damage, you should discharge static electricity from your body before you interact with any of your device’s internal electronic components, like the Bluetooth plug-in.

You can protect against ESD and discharge static electricity from your body by touching a metal grounded object (such as an unpainted metal surface on your device) before you interact with anything electronic.

You can also take the following steps to prevent damage from electrostatic discharge:
• When unpacking a static-sensitive component from its shipping carton, do not remove the component from the antistatic packing material until you are ready to install the component. Just before unwrapping the antistatic package, be sure to discharge static electricity from your body.
• When transporting a sensitive component, first place it in an antistatic container or packaging.
• Handle all electrostatic sensitive components in a static-safe area. If possible, use antistatic floor pads and work bench pads.
Technical Specs

Input:
- Supply Voltage: 230 Vac / 50-60 Hz. Single phase. **For PWS3.x: Max one Power Supply per phase, use different phases for AWD operation.**
- Power Consumption: 16 Amp brake: max 3.2 KW, 23 Amp brake: max 4.6 KW

Output:
- **Max Brake Voltage:** 200 VDC, 100 VDC, 70 VDC, 50 VDC
- **Max Brake Current:** up to 21A

PWS3.x
- Modulation Method: Phase Angle Control (SCRs) @ 100 Hz
- Inductive Load Control: Flywheel diode (passive discharge)

HS-PWS
- Modulation Method: PWM (IGBTs) @ 1000 Hz
- Inductive Load Control: Flywheel diode (passive discharge)

HS-PWS-Discharge
- Modulation Method: PWM (partial H-bridge topology) @ 1000 Hz
- Inductive Load Control: Regenerative discharge (-200VDC) + Overvoltage Control

Control lines:
- **PWM input:** PWM 0 to 5 Volt, 2.4 Khz. ISOLATED:
  - + Brake output (SP4/SP5)
  - - GND
- **Analog input (optional):** 0 to 5 Volt. ISOLATED:
  - 3 pin connector
    - Pin 1: GND
    - Pin 2: Analog in
    - PIN 3: 5V (low current for potentiometer)

Other:
- **Working Conditions:** Temperature: -10ºC to 40ºC, humidity < 90%
- **Storage Conditions:** Temperature: -20ºC to 80ºC, humidity < 80%
- **Current Control:** P.I. regulator (Proportional Integral)
Connections for Brake Power Supply PWS3.1 (GEN 3) (FW1.11)

Note: **brake must not be operated without the GND wire.** If brake has leakages it must be repaired before using it with the Power Supply.

**Configuration Procedure**
- Disconnect PWS3.1 from grid
- Remove Plastic box screws (4)
- Remove LCD display nuts and washers (2 + 2), and then LCD Display
- Locate solder Jumpers (J1 to J5)

HS-PWS High Speed Power Supply (IGBT @ 1KHz)

Note: **brake must not be operated without the GND wire.** If brake has leakages it must be repaired before using it with the Power Supply

PWS rectifies AC on a DC bus, and then DC is applied through an IGBT transistor to the eddy current brake changing duty cycle (PWM) at 1000 Hz which provides a slightly faster control than PWS3.x and less ripple on the current output.

**Jumpers for HS-PWS**

Differences between PWS3.x and HS-PWS power supplies

Due to the high inductance of eddy current brakes, power supply provides a control based on current (higher voltages during transients). **Nevertheless, the first transient (say from 0A to 10A) is always slow as it is limited by the brake (up to 500 ms)**

Most power supplies feed the brake directly from grid using SCRs (thyristors) which actively rectify AC on DC for the brake. This topology has several advantages: robustness, simplicity, constant load on the AC grid (no current peaks). On the other hand, SCRs need to be synchronized with the grid frequency, this limits the control frequency to 100 Hz, this makes control performance slightly poorer than HS-PWS.

In HS-PWS, AC is rectified to DC and then it is applied to the brake using an IGBT transistor (PWM). Our HS-PWS operates at 1000 Hz to minimize interferences. This provides a faster control than PWS3.x

**HS-PWS** has several advantages: More linear output, low ripple current, more accurate and faster control on transients. On the other hand HW-PWS has the following disadvantages: more heat dissipation, more electric interferences on the load cell, audible operation.

To summarize: all power supplies have an initial delay caused by the brake, but HS-PWS provides more accurate control during small transients and clean current. Nevertheless, due to the lower interferences, PWS3.x are being improved to be able **replace HS-PWS**.

What is HS-PWS-D (discharge)? Power supplies can charge the brake fastly, but when the discharge is required they passively discharge the brake through a flywheel diode. Although discharge is fast from 100% to about 20% of brake range, **when 20% is reached discharge becomes extremely slow (up to 5 seconds)**. HS-PWS-D is able to regenerate the stored energy and dissipate the voltage excess using resistors. This consumes the brake energy very fast and provides an accurate control on brake de-energizing process.

When is this useful? Actually, for most dynamometers this is almost NOT noticeable as they normally operate in the recommended region (approx 20% to 80%) and especially on roller dynos, whose inertia minimizes the effect of the remaining brake torque. But for HUB dynos, and engine dynamometers with big brakes and small engines and low inertia, it can make a difference as the brake can operate in the 0% to 20% range and remove the remaining torque very fast.
